Adjustment

15 Adjustment

Please observe all notes from Chapter 1 Safety of the instruction manual! In particular care must be taken to see that all protective devices are refitted properly after adjustment, see Chapter 1.06 Danger warnings of the instruction manual!

If not otherwise stated, the machine must be disconnected from the electrical power supply.

15.01 Notes on adjustment

All following adjustments are based on a fully assembled machine and may only be carried out by expert staff trained for this purpose. Machine covers, which have to be removed and replaced to carry out checks and adjustments, are not mentioned in the text. The order of the following chapters corresponds to the most logical work sequence for machines which have to be completely adjusted. If only specific individual work steps are carried out, both the preceding and following chapters must be observed. Screws, nuts indicated in brackets ( ) are fastenings for machine parts, which must be loosened before adjustment and tightened again afterwards.

15.02 Tools, gauges and other accessories

- 1 set of screwdrivers with blade widths from 2 to 10 mm
- 1 set of spanners with jaw widths from 7 to 14 mm
- 1 set of Allen keys from 1.5 to 6 mm
- 1 metal ruler, part no. 08-880 218-00
- 1 machine zero point gauge, part number 61-111 637-08
- 1 gauge button, part number 61-111 635-6

15.03 Abbreviations

t.d.c. = top dead centre
b.d.c. = bottom dead centre

15.04 Explanation of the symbols

In this adjustment manual, symbols emphasize operations to be carried out or important information. The symbols used have the following meaning:

Note, information

Service, repair, adjustment, maintenance
(work to be carried out by qualified staff only)
15.05  Basic position of the machine

Requirement
After the machine has been switched on, it should position in t.d.c. needle bar.

- Switch on the machine.
- Hold coupling part 1 and bring the needle bar (screws 2) into the appropriate position by turning the balance wheel.
- Switch off the machine.

The distance from the clutch 1 to the motor plate should be 3.5 mm. In the direction of rotation the second screw of the clutch section 3 should be on the surface of the motor shaft. The clutch section 1 should be touching the 0-ring of the axial bearing.
15.06 Button clamp zero point

Requirement
After the machine has been switched on and parameter "608" selected,
1. the needle should be centred to the hole in the adjustment gauge,
2. the switch lugs 2 and 4 should be centred to the respective initiator.

Preliminary adjustment
- Remove the button clamp holder and the lower feed plate.
- Screw adjustment gauge 1 (part no. 61-111 637-08) to the button clamp drive unit.

Fine adjustment
- Switch on the machine.
- In the input mode, select parameter "608", see Chapter 11.03 Parameter input in the instruction manual.
Adjustment

- If necessary, enter the access code, see Chapter 11.05.01 Entering the access code in the instruction manual.

- With the corresponding +/- key move the button clamp drive unit in accordance with requirement 1, also see Chapter 11.03 Parameter input.

- Switch off the machine.
- Remove adjustment gauge 1.
- Fit the lower feed plate and button clamp holder.

If, during the fine adjustment, the setting is \( \pm 5 \) increments above or below the value in X- and Y-direction, the setting should be checked again in accordance with requirement 2.
Regel
The feeder should be aligned in the “X and Y direction” in such a way that the feeder cut-out does not touch the raised needle hole 3 during sewing.

Switch on the machine.
Set the sewing area size (see Chapter 9.07 Adjusting the size of sewing area in the instruction manual)
In the input mode, select parameter "610", see Chapter 11.03 Parameter input in the instruction manual
If necessary, enter the access code, see Chapter 11.04.01 Entering the access code in the instruction manual.
Align feeder 1 (screw 2) so that the raised needle hole 3 is positioned in the centre of the feeder cutout.

Checking the "Y-direction"
To check this adjustment, move along the maximum set sewing area size in "Y-direction" by pressing the corresponding +/- keys (readjust if necessary).
Call up parameter "609".

Checking the "X-direction"

- Move along the maximum set sewing area size in "X-direction" by pressing the corresponding +/- keys.

- If necessary adjust the position of feeder 1 by entering a correction value "X" with the corresponding +/- keys in "X-direction" in accordance with the requirement.

- Conclude the input.
15.08 Aligning the button clamp

Requirement
The button clamp should be aligned in "X" and "Y" direction, so that the needle penetrates the centre of the gauge button.

- Insert gauge button 1 (part number 61-111 635-66) and switch on the machine.
- In the input mode select parameter "609", see Chapter 11.03 Parameter input of the instruction manual (machine moves to "0-position").
- If necessary, enter the access code, see Chapter 11.05.01 Entering the access code in the instruction manual.
- Adjust button clamp 2 (screws 3) in "X and Y direction" in accordance with the requirement.
- Conclude the input, remove the gauge button and switch off the machine.
15.09 Hook driver

Requirement
1. When the balance wheel is turned, the machine should not bind.
2. The play of catch 7 should be less than 0.1 mm.

- Remove the hook.
- Loosen screws 1, 2 and 3 (remove motor 4).
- Move the eccentric shaft 5 in accordance with requirement 1 and twist it in accordance with requirement 2.
- Tighten screws 1 and 3.
- Move adjustment ring 6 against the metal edge and tighten screw 2.
- Insert the hook.

If catch 7 has too much play, the running noise of the machine increases. Too little play may cause the machine to jam.
15.10 Needle height

**Requirement**

With the needle bar in b.d.c., the upper marking on the needle bar 1 should be flush with the lower edge of the needle bar bush.

- Adjust needle bar 1 (screw 2) in accordance with the requirement.
15.11 Hook-to-needle clearance

**Requirement**
When the bottom marking of the ascending needle bar is level with the lower edge of the needle bar bush

1. the hook point 5 should be at a distance of 0.05 – 0.1 mm from the needle groove.
2. the distance between the needle and the tip of the hook race should be 7.5 mm.

- Loosen screws 1, 2 and 3.
- Turn the eccentric pin 4 in accordance with the **requirements**.
- Tighten screws 2 and 3.

Screw 1 remains loosened for further adjustments.
15.12 Needle rise and needle guard

Requirement
When the bottom marking of the ascending needle bar is level with the lower edge of the needle bar bush
1. the hook point should be centred to the needle and
2. the needle guard (see arrow) should slightly touch the needle.

- Turn catch 1 (screw 2) in accordance with requirement 1, or move it in accordance with requirement 2.
15.13 Aligning the hook race cover

**Requirement**
The needle should be centred to cutout B and the rear side of the needle flush to the imaginary line A.

- Move the hook race cover 1 (screws 2) in accordance with the requirement.
Adjustment

15.14 Button clamp height

Requirement
The button clamp should be **13 mm** above the upper edge of the needle plate.

- Turn lever 1 (nut 2 and screw 3) in accordance with requirement.

⚠️ After aligning the button clamp, it is imperative to check the position of the thread wiper, see Chapter 15.16 Position of the thread wiper! Danger of needle breakage!
15.15 Button clamp pressure

Requirement
The pressure of the button clamp should be set so that the workpiece can be held reliably without pressure marks.

- Adjust milled screw 1 in accordance with the requirement.
15.16 Position of the thread wiper

<table>
<thead>
<tr>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>When the thread wiper is centred to the needle, its lower edge should be <strong>14 – 15 mm</strong> above the upper edge of the needle plate.</td>
</tr>
</tbody>
</table>

- Bring thread wiper 1 into the appropriate position
- Move thread wiper 1 (screw 2) in accordance with the **requirement**.
15.17 Position of the control cam

**Requirement**
1. The markings on control cam 1 and arm shaft 3 should correspond with each other.
2. The outer edge of control cam 1 should be at a distance of 32.5 mm from the metal surface of the case.

- Turn control cam 1 (screw 2) in accordance with **requirement 1**, or move it in accordance with **requirement 2**.
15.18 Position of the control roller

Requirement
When the needle bar is at its b.d.c., the control roller should be centred to the running path of control cam 2.

- Turn screw 3 (nut 4) in accordance with the requirement.
- For checking purposes, operate lever 1 by hand to let the control roller fall into the running path of control cam 2.
15.19  Position of the drive shaft of the thread trimmer

Requirement
When the thread trimmer is in its basic position, shaft 1 should be flush with the metal edge of the machine case.

- Move shaft 1 (screws 2 and 3) in accordance with the requirement.
15.20 Aligning the stop plate

**Requirement**
When the thread trimmer is in its basic position, there should be a clearance of **0.3 mm** between lever 3 and plate 1.

- Move plate 1 (screws 2) in accordance with the requirement.
15.21 Adjusting the trimmer solenoid

Requirement
When the thread trimmer is in its neutral position, solenoid 1 should be at a distance of 5 mm from the case.

- Turn nut 1 (nut 2) in accordance with the requirement.
Adjustment

15.22 Adjusting the engaging lever

**Requirement**
When the thread trimmer is in its neutral position, pin 3 should be at a distance of 0.5 mm from release trip 4.

Move lever 1 (screws 2) in accordance with the requirement.
15.23 Position of the thread catcher and knife

**Requirement**

When the machine is in its basic position

1. The tip of the thread catcher 1 should be at a distance of **4.5 mm** from the centre of the needle hole.
2. The blade of knife 3 should be at distance of **0.5 mm** from the needle plate insert.

- Adjust thread catcher 1 (screw 2) in accordance with requirement 1.
- Adjust knife 3 (screws 4) in accordance with requirement 2.
15.24 Position of the release trip

Requirement
The slots of trip 1 should be touching screws 2 on the right side.

- Move trip 1 (screws 2) in accordance with the requirement.

If the needle thread is too short after trimming, trip 1 can be slightly readjusted.
15.25 Position of the release catch

**Requirement**
When lever 6 is touching release catch 7, there should be a distance of **0.3 mm** between drive lever 5 and pin 1.

- Turn the balance wheel until pin 1 is no longer on the release trip 2.
- Release spring 3 and loosen screws 4.
- In accordance with the requirement, place the feeler gauge between the drive lever 5 and pin 1.
- Push lever 6 lightly in the direction shown by the arrow.
- Move release catch 7 against lever 6 and tighten screws 4.
- Remove the feeler gauge and attach spring 3.

⚠️ Spring 3 should only be released and attached with suitable tools!
Danger of injury!
15.26 Needle thread tension release

<table>
<thead>
<tr>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>After thread trimming the distance X between tension discs 3 should be 0.6 – 0.8 mm for normal materials and 0.8 – 1.0 mm for heavy materials.</td>
</tr>
</tbody>
</table>

- Bring the machine into the cutting position by hand.
- Move lever 1 (screw 2) in accordance with the requirement.
15.27 Thread check spring and thread regulator

Requirement
1. The thread check spring 1 should have a 6 – 8 mm stroke.
2. Screw 4 should be positioned in the centre of the slot of thread regulator 3.

Adjust thread check spring 1 (screw 2) in accordance with requirement 1.
Move thread regulator 3 (screw 4) in accordance with requirement 2.

Turn pin 5 to adjust the thread spring resistance. All settings of the thread check spring 1 depend on the material and might have to be corrected to achieve the desired result.
**Adjustment**

15.28 Bobbin winder drive wheel

**Requirement**
1. There should be a distance of approx. **10.5 mm** between drive wheel 1 and the metal edge of the machine case.
2. When the bobbin winder is switched on, its friction wheel should be driven by drive wheel 1. When the bobbin winder is switched off, drive wheel 1 must not touch the friction wheel of the bobbin winder.

- Adjust drive wheel 1 (screw 2) in accordance with the requirements.
15.29 Button clamp initiator

Requirement
When the button clamp is lowered, the initiator should be actuated (input "3" parameter '601' is in the "Off" position).

- Switch on the machine and press the "TE" key.
- Lower the button clamp by pressing the "tacting forwards" key.
- With the clamp in this position, press the "TE" key.
  - In the input mode, select parameter '601', see Chapter 11.03 Parameter input in the instruction manual.
  - Select input "3" with the corresponding +/− key.
  - If necessary, enter the access code, see Chapter 11.05.01 Entering the access code in the instruction manual.
- Move cam switch 1 by hand and check the ON/OFF switch position on the display.
- Adjust support 2 (screws 3) and cam switch 1 (screws 4) in accordance with the requirement.
- Switch off the machine.
15.30 Changing the feeder and the jaws of the button clamp

- Measure the cutout of the new feeder in X- and Y-direction and adjust the sewing area size, see Chapter 9.07 Button clamp and sewing area size of the instruction manual.
- Fit and align the new button clamp jaws, see Chapter 15.08 Aligning the button clamp.
- Select the seam program to match the button clamp, see Chapter 9.06 Selecting a seam program of the instruction manual.
- Check the seam program by tacting through it, see Chapter 7.05.03 Function keys of the instruction manual.

⚠️ If the actual size of the sewing area differs from the size entered, serious damage can be caused to the machine!
15.31 Cold start

When a cold start is carried out, the seam patterns 50 – 99 and all altered parameter settings are deleted! The machine is reset to its condition on delivery, the machine’s zero points remain unaffected.

- Switch on the machine.
- Select parameter '607" with the corresponding +/- keys.
- If necessary, enter the code, see Chapter 11.05.01 Entering the access code in the instruction manual.
- With the corresponding +/- key carry out the reset operation.
- Switch the machine off and on again after approx. 3 seconds.
15.32 Internet update of the machine software

The machine software can be updated with PFAFF flash programming. For this purpose the PFP boot program and the appropriate control software for the machine type must be installed on a PC. To transfer the data to the machine, the PC and the machine control unit must be connected with an appropriate null modem cable (part no. 91-291 998-91).

The PFP boot program and the control software of the machine type can be downloaded from the PFAFF-homepage using the following path:
www.pfaff-industrial.de/pfaff/de/service/downloads

To update the machine software carry out the following steps:

- While the machine software is being updated, no setting up, maintenance or adjustment work may be carried out on the machine!

- Switch off the machine.
- Connect the PC (serial interface or appropriate USB-adapter) and the machine control unit (RS232). To do so disconnect the plug of the control panel.
- Switch on the PC and start the PFP boot program.
- Select the machine type.
- Press the "programming" button.
- Switch on the machine, keeping the boot key 1 pressed.
- Press the "OK" button.
  The software update is carried out, the update progress is shown on the bar display of the PFP boot program.
- When the update has been completed, switch off the machine and end the PFP boot program.
- End the connection between the PC and the machine control unit and reconnect the control panel to the machine control unit.
- Switch on the machine.
  A plausibility control is carried out and, if necessary, a cold start.

More information and assistance is at your disposal in the file "PFPHILFE.TXT", which can be called up from the PFP boot program by pressing the "help" button.

</thead>
</table>
| 000   | 007       | Starting point = scale reference point  
 With this parameter it is possible to choose whether the scale reference point is the starting point (ON) or the zero point (OFF). | ON – OFF | OFF |
| 008   | 008       | Speed for the "winding" function  
 This parameter is used to fix the speed for the winding operation. | 500 2500 | 1500 |
| 009   | 009       | Via zero point to starting point after end of sequence  
 With this parameter it is possible to choose that, after the end of the sequence, the X-, Y-drive moves to the seam starting point via the reference initiators. | ON – OFF | OFF |
| 010   | 010       | Via zero point to starting point after number of program cycles  
 Number of program cycles  
 With this parameter it is possible to choose that, after a certain number of program cycles, the X-, Y-drive moves to the seam starting point via the reference initiators. | ON –OFF  
 1 - 100 | OFF |
| 011   | 011       | Pedal mode  
 Switchover between level mode (0) and flip flop mode (1). | 0 – 1 | 0 |
| 012   | 012       | Needle or balance wheel position in degrees | 0 - 360 | 11 |
| 013   | 013       | NIS "needle in material" [°]  
 This parameter is used to set the NIS signal. If the function is executed, the position can be entered by turning the balance wheel. If the position is altered, the result is a change in the point of time when the carriage is moved. The access code is necessary for this adjustment. | 65 – 166 | 107 |
| 014   | 014       | Thread trimming speed [min-1]  
 This parameter is used to fix the speed for thread trimming. | 100 – 700 | 300 |

### Display special inputs

With this function it is possible to check the special inputs pedal, reference X (SM1) and reference Y (SM2). "IN" shows the inputs (PED, REFX, REFY). Under "VAL" the respective switch status is displayed.

<table>
<thead>
<tr>
<th>IN</th>

</tr>
</tbody>
</table>

### Connect outputs

With this function the outlets can be connected. "OUT" shows the outlet selected (1-16). Under "VAL" the selected output is set (S) with the plus/minus key (+), and reset (R) with the plus/minus key. Interlocks are checked. Non-assigned outlets are not connected.

### Move stepping motors

The stepping motors SM1 (X-axis) and SM2 (Y-axis) are moved individually with the respective plus/minus keys. Interlocks are not checked.
### Adjustment

<table>
<thead>
<tr>
<th>Group</th>
<th>Parameter</th>
<th>Description</th>
<th>Setting range</th>
<th>Set value</th>
</tr>
</thead>
</table>
| 600   | 605       | Turn sewing motor  
The sewing motor can be operated with a selectable set speed by pressing the pedal. After the sewing motor has been started, the current speed is also displayed. | 500 - 2500 | 500 |
| 606   |           | Thread trimming sequence  
The sequence for a complete thread trimming cycle is started with the plus/minus key (+) below CUT and below THR. |           |   |
| 607   |           | Cold start (RESET)  
With this function the control unit carries out a cold start (RESET) with which the data is reset. After this function has been selected, the machine must be switched off and then on again. |           |   |
| 608   |           | Setting zero points  
With this function and the adjustment gauge, the zero points for the XY-drive unit can be set. (stepping motor correction values for the reference points REFX, REFY). The access code is required for this adjustment. |           |   |
| 609   |           | Setting the button clamp centre X  
This function is used to set the centre of the button clamp in X-direction. When entering the function, the machine moves to the current button clamp centre, after which it is possible to move to the right or left edge, depending on the set limits (param. “023”). A correction can be made with the plus/minus keys. The relocation value is displayed. |           |   |
| 610   |           | Setting the button clamp centre Y  
This function is used to help set the centre of the button clamp in Y-direction. After entering this function, the machine moves to the current button clamp centre, after pressing a key to the front or the rear limit (param. “024”). The button clamp must be shifted manually. |           |   |
