Adjustment

14 Adjustment

Please observe all notes from Chapter 1 Safety of the instruction manual! In particular care must be taken to see that all protective devices are refitted properly after adjustment, see Chapter 1.06 Danger warnings of the instruction manual!

If not otherwise stated, the machine must be disconnected from the electrical power supply.

14.01 Notes on adjustment

All following adjustments are based on a fully assembled machine and may only be carried out by expert staff trained for this purpose. Machine covers, which have to be removed and replaced to carry out checks and adjustments, are not mentioned in the text.

The order of the following chapters corresponds to the most logical work sequence for machines which have to be completely adjusted. If only specific individual work steps are carried out, both the preceding and following chapters must be observed.

Screws, nuts indicated in brackets ( ) are fastenings for machine parts, which must be loosened before adjustment and tightened again afterwards.

14.02 Tools, gauges and other accessories

- 1 set of screwdrivers with blade widths from 2 to 10 mm
- 1 set of spanners with jaw widths from 7 to 14 mm
- 1 set of Allen keys from 1.5 to 6 mm
- 1 metal ruler, part no. 08-880 218-00

14.03 Abbreviations

t.d.c. = top dead centre
b.d.c. = bottom dead centre

14.04 Explanation of the symbols

In this adjustment manual, symbols emphasize operations to be carried out or important information. The symbols used have the following meaning:

- Note, information

- Service, repair, adjustment, maintenance
  (work to be carried out by qualified staff only)
14.05 Basic position of the machine

Requirement
After the machine has been switched on, it should position in t.d.c. needle bar.

- Switch on the machine.
- Hold coupling part 1 and bring the needle bar (screws 2) into the appropriate position by turning the balance wheel.
- Switch off the machine.

The distance from the clutch 1 to the motor plate should be 3.5 mm. Coupling part 1 should be touching the O-ring of the thrust bearing.
14.06 Button clamp zero point

Requirement
After the machine has been switched on and parameter "608" selected,
1. the needle should be centred to the hole in the adjustment gauge,
2. the switch lugs 2 and 4 should be centred to the respective initiator.

● Remove the button clamp holder and the lower feed plate.
● Screw adjustment gauge 1 (part no. 61-111 637-08) to the work clamp drive unit.

Preliminary adjustment
● Move the button clamp drive unit by hand in accordance with requirement 1.
● Adjust switch lug 2 (screw 3) and switch lug 4 (screw 5) in accordance with requirement 2.

Fine adjustment
● Switch on the machine.
● In the input mode, select parameter "608", see Chapter 11.03 Parameter input in the instruction manual.
Adjustment

- If necessary, enter the access code, see Chapter 11.05.01 Entering the access code in the instruction manual.

- With the corresponding plus/minus key move the button clamp drive unit in accordance with requirement 1, also see Chapter 11.03 Parameter input.

- Switch off the machine.
- Remove adjustment gauge 1.
- Fit the lower feed plate and button clamp holder.
Adjustment

14.07 Aligning the button clamp

Requirement
The button clamp should be aligned in „X“ and „Y“ direction, so that the needle penetrates the centre of the gauge button.

- Insert gauge button 1 and switch on the machine.
- Set the sewing area size (see Chapter 9.07 Adjusting the size of sewing area in the instruction manual)
- In the input mode, select parameter "609", see Chapter 11.03 Parameter input in the instruction manual
- If necessary, enter the access code, see Chapter 11.05.01 Entering the access code in the instruction manual.
- With the plus/minus keys move the button clamp 2 in the X-direction in accordance with the requirement.
- Select parameter „610“ and move button clamp 2 (screws 3) in the X- and Y-direction in accordance with the requirement.
- Conclude the input, remove the gauge button and switch off the machine.
14.08 Hook driver

Requirement
1. When the balance wheel is turned, the machine should not bind.
2. The play of catch 7 should be less than 0.1 mm.

- Remove the hook.
- Loosen screws 1, 2 and 3 (remove motor 4).
- Move the eccentric shaft 5 in accordance with requirement 1 and twist it in accordance with requirement 2.
- Tighten screws 1 and 3.
- Move adjustment ring 6 against the metal edge and tighten screw 2.
- Insert the hook.

If catch 7 has too much play, the running noise of the machine increases. Too little play may cause the machine to jam.
14.09 Needle height

Requirement
With the needle bar in b.d.c., the upper marking on the needle bar 1 should be flush with the lower edge of the needle bar bush.

- Adjust needle bar 1 (screw 2) in accordance with the requirement.
14.10 Hook-to-needle clearance

Requirement
When the bottom marking of the ascending needle bar is level with the lower edge of the needle bar bush
1. the hook point should be at a distance of 0.05 – 0.1 mm from the needle groove.
2. the distance between the needle and the tip of the hook race should be 7.5 mm.

- Loosen screws 1, 2 and 3.
- Turn the eccentric pin 4 in accordance with the requirements.
- Tighten screws 2 and 3.

Screw 1 remains loosened for further adjustments.
14.11 Needle rise and needle guard

**Requirement**
When the bottom marking of the ascending needle bar is level with the lower edge of the needle bar bush
1. the hook point should be centred to the needle and
2. the needle guard (see arrow) should slightly touch the needle.

- Turn catch 1 (screw 2) in accordance with requirement 1, or move it in accordance with requirement 2.
14.12 Aligning the hook race cover

Requirement
The needle should be centred to cutout B and the rear side of the needle flush to the imaginary line A.

- Move the hook race cover 1 (screws 2) in accordance with the requirement.
14.13 Button clamp height

Requirement
The button clamp should be 13 mm above the upper edge of the needle plate.

Turn lever 1 (nut 2 and screw 3) in accordance with requirement.

⚠️ After aligning the button clamp, it is imperative to check the position of the thread wiper, see Chapter 14.15. Position of the thread wiper! Danger of needle breakage!
14.14 Button clamp pressure

Requirement
The pressure of the button clamp should be set so that the workpiece can be held reliably without pressure marks.

- Adjust milled screw 1 in accordance with the requirement.
**Adjustment**

14.15 Position of the thread wiper

**Requirement**
When the thread wiper is centred to the needle, its lower edge should be 14 – 15 mm above the upper edge of the needle plate.

- Bring thread wiper 1 into the appropriate position
- Move thread wiper 1 (screw 2) in accordance with the requirement.
14.16 Position of the control cam

Requirement
1. The markings on control cam 1 and arm shaft 3 should correspond with each other.
2. The outer edge of control cam 1 should be at a distance of 32.5 mm from the metal surface of the case.

Turn control cam 1 (screw 2) in accordance with requirement 1, or move it in accordance with requirement 2.
Adjustment

14.17 Position of the control roller

Requirement
When the needle bar is at its b.d.c., the control roller should be centred to the running path of control cam 2.

- Turn screw 3 (nut 4) in accordance with the requirement.
- For checking purposes, operate lever 1 by hand to let the control roller fall into the running path of control cam 2.
14.18 Position of the drive shaft of the thread trimmer

Requirement
When the thread trimmer is in its basic position, shaft 1 should be flush with the metal edge of the machine case.

- Move shaft 1 (screws 2 and 3) in accordance with the requirement.
14.19 Aligning the stop plate

**Requirement**
When the thread trimmer is in its basic position, there should be a clearance of 0.3 mm between lever 3 and plate 1.

- Move plate 1 (screws 2) in accordance with the requirement.
14.20 Adjusting the trimmer solenoid

Requirement
When the thread trimmer is in its neutral position, solenoid 1 should be at a distance of 5 mm from the case.

- Turn nut 1 (nut 2) in accordance with the requirement.
Adjustment

14.21 Adjusting the engaging lever

Requirement
When the thread trimmer is in its neutral position, pin 3 should be at a distance of 0.5 mm from release trip 4.

Move lever 1 (screws 2) in accordance with the requirement.
14.22 Position of the thread catcher and knife

Requirement
When the machine is in its basic position
1. The tip of the thread catcher 1 should be at a distance of 4.5 mm from the centre of the needle hole.
2. The blade of knife 3 should be at distance of 0.5 mm from the needle plate insert.

- Adjust thread catcher 1 (screw 2) in accordance with requirement 1.
- Adjust knife 3 (screws 4) in accordance with requirement 2.
14.23 Position of the release trip

Requirement
The slots of trip 1 should be touching screws 2 on the right side.

- Move trip 1 (screws 2) in accordance with the requirement.

If the needle thread is too short after trimming, trip 1 can be slightly readjusted.
14.24 Position of the release catch

Requirement
When lever 6 is touching release catch 7, there should be a distance of 0.3 mm between drive lever 5 and pin 1.

- Turn the balance wheel until pin 1 is no longer on the release trip 2.
- Release spring 3 and loosen screws 4.
- In accordance with the requirement, place the feeler gauge between the drive lever 5 and pin 1.
- Push lever 6 lightly in the direction shown by the arrow.
- Move release catch 7 against lever 6 and tighten screws 4.
- Remove the feeler gauge and attach spring 3.

Spring 3 should only be released and attached with suitable tools!
Danger of injury!
14.25 Needle thread tension release

Requirement
After thread trimming the distance X between tension discs 3 should be 0.6 - 0.8 mm for normal materials and 0.8 - 1.0 mm for heavy materials.

- Bring the machine into the cutting position by hand.
- Move lever 1 (screw 2) in accordance with the requirement.
14.26 Thread check spring and thread regulator

Requirement
1. The thread check spring 1 should have a 6 – 8 mm stroke.
2. Screw 4 should be positioned in the centre of the slot of thread regulator 3.

- Adjust thread check spring 1 (screw 2) in accordance with requirement 1.
- Move thread regulator 3 (screw 4) in accordance with requirement 2.

Turn pin 5 to adjust the thread spring resistance. All settings of the thread check spring 1 depend on the material and might have to be corrected to achieve the desired result.
### Adjustment

#### 14.27 Bobbin winder drive wheel

**Requirement**

1. There should be a distance of approx. 10.5 mm between drive wheel 1 and the metal edge of the machine case.
2. When the bobbin winder is switched on, its friction wheel should be driven by drive wheel 1. When the bobbin winder is switched off, drive wheel 1 must not touch the friction wheel of the bobbin winder.

- Adjust drive wheel 1 (screw 2) in accordance with the requirements.

---

**Fig. 14 - 23**

![Diagram showing the distance between drive wheel 1 and the metal edge of the machine case, with an arrow pointing to the distance of 10.5 mm.]
14.28 Bobbin winder

Requirement
The bobbin winder should switch off automatically, when the thread level is about 1 mm from the edge of the bobbin.

- Turn lever 1 (screw 2) in accordance with the requirement.
14.29 Button clamp initiator

Requirement
When the button clamp is lowered, the initiator should be actuated (input "3" parameter "601" is in the "Off" position).

- Switch on the machine.
- In the input mode, select parameter "601", see Chapter 11.03 Parameter input in the instruction manual.
- Select input "3" with the corresponding plus/minus key.
- If necessary, enter the access code, see Chapter 11.05.01 Entering the access code in the instruction manual.
- Adjust bracket 1 (screws 2) and switch lug 3 (screws 4) in accordance with the requirement.
- Switch off the machine.
14.30 Changing the feeder and the jaws of the button clamp

- Measure the cutout of the new feeder in X- and Y-direction and adjust the sewing area size, see Chapter 9.07 Button clamp and sewing area size of the instruction manual.
- Fit and align the new button clamp jaws, see Chapter 14.07 Aligning the button clamp.
- Select the seam program to match the button clamp, see Chapter 9.06 Selecting a seam program of the instruction manual.
- Check the seam program by tacting through it, see Chapter 7.05.03 Function keys of the instruction manual.

⚠️ If the actual size of the sewing area differs from the size entered, serious damage can be caused to the machine!
Adjustment

14.31 Cold start

When a cold start is carried out, the seam patterns 50 - 99 and all altered parameter settings are deleted! The machine is reset to its condition on delivery, the machine’s zero points remain unaffected.

- Switch on the machine.
- Select parameter "607" with the corresponding plus/minus keys.
- If necessary, enter the code, see Chapter 11.05.01 Entering the access code in the instruction manual.
- With the corresponding plus/minus key carry out the reset operation.
- Switch the machine off and on again after approx. 3 seconds.
14.32  Internet update of the machine software

The machine software can be updated with PFAFF flash programming. For this purpose the PFP boot program and the appropriate control software for the machine type must be installed on a PC. To transfer the data to the machine, the PC and the machine control unit must be connected with an appropriate null modem cable (part no. 91-291 998-91).

The PFP boot program and the control software of the machine type can be downloaded from the PFAFF-homepage using the following path:

www.pfaff-industrial.com/de/service/download/steuerungssoftware.html

To update the machine software carry out the following steps:

⚠️ While the machine software is being updated, no setting up, maintenance or adjustment work may be carried out on the machine!

- Switch off the machine.
- Connect the PC (serial interface or appropriate USB-adapter) and the machine control unit (RS232). To do so disconnect the plug of the control panel.
- Switch on the PC and start the PFP boot program.
- Select the machine type.
- Press the “programming” button.
- Switch on the machine, keeping the boot key 1 pressed.
- Press the “OK” button.

The software update is carried out, the update progress is shown on the bar display of the PFP boot program.
- When the update has been completed, switch off the machine and end the PFP boot program.
- End the connection between the PC and the machine control unit and reconnect the control panel to the machine control unit.
- Switch on the machine.

A plausibility control is carried out and, if necessary, a cold start.

More information and assistance is at your disposal in the file “PFPHILFE.TXT”, which can be called up from the PFP boot program by pressing the “help” button.
## Adjustment

### 14.33 List of parameters

<table>

</tbody>
</table>
| 000   | 009       | Via zero point to starting point after end of sequence  
With this parameter it is possible to choose that, after the end of the sequence, the X-, Y-drive moves to the seam starting point via the reference initiators. | ON –OFF | OFF |
| 010   |           | Via zero point to starting point after number of program cycles  
Number of program cycles  
With this parameter it is possible to choose that, after a certain number of program cycles, the X-, Y-drive moves to the seam starting point via the reference initiators. | ON –OFF  
1 - 100 | OFF |
| 011   |           | Pedal mode  
Switchover between level mode (0) and flip flop mode (1). | 0 – 1 | 0 |
| 013   |           | NIS "needle in material" [°]  
This parameter is used to set the NIS signal. If the function is executed, the position can be entered by turning the balance wheel. If the position is altered, the result is a change in the point of time when the carriage is moved. The access code is necessary for this adjustment. | 65 – 166 | 107 |
| 014   |           | Thread trimming speed [min-1]  
This parameter is used to fix the speed for thread trimming. | 100 – 700 | 200 |
| 015   |           | Reduced current for stepping motors  
The reduction function of the holding current at rest with closed work clamp is switched on or off. | ON – OFF | ON |
| 016   |           | Key tone  
The key tone, as reaction to a key on the control panel being pressed, is switched on or off. The double tone for incorrect inputs always remains switched on. | ON – OFF | ON |

<td></td>
</tr>
</tbody>
</table>
With this function the control unit carries out a cold start (RESET) with which the data is reset. After this function has been selected, the machine must be switched off and then on again.

With this function and the adjustment gauge, the zero points for the X/Y-drive unit can be set. (stepping motor correction values for the reference points REFX, REFY). The access code is required for this adjustment.

This function is used to set the centre of the button clamp in X-direction. When entering the function, the machine moves to the current button clamp centre, after which it is possible to move to the right or left edge, depending on the set limits (param. „023“). A correction can be made with the plus/minus keys. The relocation value is displayed.

This function is used to help set the centre of the button clamp in Y-direction. After entering this function, the machine moves to the current button clamp centre, after pressing a key to the front or the rear limit (param. „024“). The button clamp must be shifted manually.

With this function the automatic opening of the button clamp after thread trimming can be switched off. After the machine has been switched off, the automatic button clamp opening function is always activated.
These parameters influence the control of the sewing motor and should only be altered by appropriately instructed persons.

The function groups and the functions Programming the Function Keys P, P1-P8 and C1-C3 can be released for manipulation (ON) or locked (OFF). If a function group is suppressed, its parameters cannot be changed until a valid access code has been entered. Once a valid access code has been entered, the suppression is cancelled until the machine is switched off.
